In the initial feed, the level of raw protein is high (21-22% CP) and the level of metabolizable energy is low (3000 Kcal/kg ME). The crude fiber content is low (4-5% CF) because the chicks digest the fiber very well. The starter food must contain essential supplements and minerals and vitamins.A quality starter food for broiler chickens supports early early and physiological development, ensuring your chickens grow up to be healthy and profitable. A good starting feed should be based on broiler chickens and not on production costs. Click here for the standard nutritional requirements of broilersBroiler Grower (11-25 days) Broiler feed is fed to broilers at an early stage of the growing period, i.e. 11-25 days of age. At this stage of production, the diet should contain balanced crude protein (19-20% CP) and metabolizable energy (3050 Kcal/kg ME) with a fairly low fiber content (7-8% CF). Click here for the standard nutritional requirements of the broiler houseBroiler Finisher (26-42 days or more1) The broiler chicken diet is administered from the age of 26 days to 42 days or until slaughter. The diet of chickens for fattening must contain high energy and lower protein. The metabolizable energy should be 3100-3200 Kcal/kg, while the crude protein should be 18-19%. Click here for the standard nutritional requirements of the broiler finisher chickenBroiler Feeding Chart & Growth ChartWith the broiler feed and weight chart below, you will be able to answer the following questions related to feeding broiler chickens. These questions include:How much feed does broilers require before they reach market weight?What is the total amount of feed needed to feed broilers to maturity?What is the total amount of feed consumed by a broiler chickens per week?What is the growth rate of broilers?What is the average weight of a broiler chicken every week?Also, read: Layers Feed consumption and WeightGrowthExpected body weight per week and Feed consumption TableAge (Week) Feed consumed per bird (kg) Average body weight per bird kg) Week 10.1670.1670.1850.185Week 20.3750.5420.4650.280S week 40.9452.1371.5240.581Week 51.3 61.4344.7862.8570.666Week 71.5936.3793.5060.649Week 81.6918.0704.1110.605Week 91.7159.7854.649 538Note:From 538Note:From 538 Above the graph, you could infer that: a chicken consumerÃ approximately 1.2 kg of feed (grid starter + cultivator) from week 1 to week 3. A grid weighs about 1.52 kg at the end of week 4. A grilled chicken manger Approximately 8.6 kg of power supply (grid finder) from week 4 to week 9. A grid will mean body weight of 4.65 kg at the end of week 9. Form Note: The above table did not take into account the sex of grilled chicken. This is just a standard chart. Ã designed to be your guide. You can get a better body weight (for example 3 kg) before the end of week 6. Yes, click here to learn more¹. Try our simple feed calculators read: how to increase the body weight of grillers by 45 days Pdfmaneing grilled chicken feeding guide the feeding requirements and nutritional needs of the broilers Ã is crucial for optimizing the performance of the flock. Find below the link to download PDFs of the Grid Feeding Guide for various strains of broilers that include COBB 500, COBB 700, ROSS 308, ROSS 708 and ARBOR ACRES Plus. Power consumption of the broiler and weight graph [JPEG] FAQS on FAQ FAQ GROILTER. How many food bags for 50 grillers in a month? 50 grillers should consume about 130 kg of power in one month. This Ã ¨ 5 25 kg supply bags in a month. What is the maximum weight of a grid? A jumbo grille may weigh up to 8 kg.c. What is the weight of a day grid? A day-old grilled chick weighs 40-45 grams. How to calculate feed intake in poultry? This Ã is quite simple. Get a standard poultry feeding guide and check your daily, weekly or monthly chicken feeding. The best way to improve the growth of meat chickens is to feed meat chickens with our weight formula of high quality poultry and certified. Formulate and give them a good feed for meat chickens. Another way to grow chickens from meat meat Or having a greater weight is producing and nourishing them with excellent feed. Weekly feeding folder for chickens Etã (week) consumed food for volatile in overall kgmanangime consumed in medium body kgpero for volatile (kg) average weight gain per volatile (kg) week 10,130.150.11 settima 20.280.420.360.21 setting 30.470.880.650 .30 Aspects 40. 641.551.030.35 -setting 50.852.401.460.44atimana 61.073.451.920.46 Asased 71.184.662.360.45 -set 81.305.962.790.43 Subitimana 91.417.373,200.41 Different types of feeds for ™ Starting for the start -up for the start -up for the start -up for the start -up for the start -up is usually desired to meet the food needs of the chicks. The Et Pulcini between 6 and 20 weeks must have passed to the feed for farmers, which contains less proteins of the initial feed (16-18%) and less football than the typical varieties of layers. Normally, talking chicks can live comfortably with a starter and water diet for the first 6 weeks of life before moving on to the food of the farmers. The high protein content, usually between 20 and 24%, helps the chicks to grow in playful chicks, even if it is imperative to gradually eliminate the initial food to 6 weeks of life, otherwise the Excess protein can cause liver damage. Foods for Broiler growers The food feed is powered for 14-16 days after the starter. The transition from starting the farmer mainly leads to a change in consistency from crumbs or pellet mini-pellets. Depending on the size of the pellets produced, it can be necessary to feed the first administration of Grower in the form of crumbs or mini-pellets. And, during this period, the growth of meat chickens continues to be dynamic. Must be supported by an adequate one of nutrients. To optimize the intake of feed, growth and FCR, it is essential to provide correct density of nutrients, in particular of energy and amino acids. Food chickens, feed for meat chickens take into account the volume and power costs of a meat chickens. The feed must be conceived in order to maximize the financial return for the type of products that are produced. Finish finishing power supplies be administered from 25 days until transformation. Birds slaughtered after 42 to 43 days require a second specification for fisherman' feed from 42 days. Composition of broiler ration or poultry feed paper for fattening Inclusion percentage IngredientStarter (0-5 weeks)Finisher (6-7 weeks)Yellow maize4755Poultry rice810Soya meal17.513.5Peanut cake1511Dry, unsalted fish108Mineral mixture22Salt0.50.5 100100 Poultry feed sheet and paper Weight Layered poultry means raising poultry to eggs of poultry to eggs. Chickens for fattening are special species of hens to be raised from the age of one day. They begin laying eggs commercially for 18 to 19 weeks of age. They stay to lay eggs continuously until their age 72-78 weeks. They can produce about 1 kg of eggs by consuming about 2.25 kg of food during the laying period. The main purpose of producing a hybrid layer of eggs is to consider the various characteristics of the hen and rooster before breeding. There are several types of highly productive egg layer breeds available worldwide. Layered diets aim to optimize egg production in terms of number of eggs, egg size or egg mass, provide the nutrition needed to safeguard health and maintain the desired body weight. As with layer pullets, different types of breeders recommend different feeding strategies for their birds, including the number of different diets fed during the laying phase. The calcium Ã is increased for the formation of shells of egg. On average, a laying hen requires 1/4 to 1/3 of a pound of food every day, or about 1.5 pounds of food every week. Layer feed has a balance of protein, calcium and other vitamins and minerals that encourages your laying eggs at a higher level in the flock. Protein layer feed has similar levels of protein to crop feed, however, about 16-18% have more calcium¹ to ensure that their egg shells are crisp, clean and crisp. Feeding of the feeding layer for dairy chicks or chickens do not meet their unique food needs. Feed for the layers should be given to chickens around 20 weeks of age or once they have begun laying eggs. LayersÂÂ food requirements The average feed consumption during the laying period ranges from 100 to 110 grams. Feed consumption during the winter increases and food consumption during the summer season decreases. Summer and winter management need to be followed in order to achieve better crude oil percentages. Layered feed contains approximately 16 % protein and calcium in higher amounts¹, so chickens lay eggs in strong shells. Start feeding the nutrient layer at 20 weeks of age or when the first egg is laid, whichever occurs first. For the age chicks between 0 and 8 weeks, administer 40gm per chick, per day, of chicken pulp. CiÃ² equals 2 kg chicken pulp per chick for 8 weeks. For chickens or age farmers between 8 and 20 weeks, give about 80gm per bird per day, meal growers. CiÃ² is equivalent to 8-9 kg of feed per bird for about 12 weeks. For birds, the 20-76 weeks of age they allow 120-130gm per bird, per day of layer mush and these amount to about 45 kg of layer mush per bird from 20 to 76 weeks of age. Feeding chickens for fattening There are several companies worldwide that produce feed and food supplements for chickens for fattening. You can buy feed from the local market or feed at home. You need to make sure that purchased feed and food supplements are enriched with an essential food value. Proteins, vitamins and minerals are important for laying hens that are affecting quality eggs, fertility layer poultry and layer bird health ÂÂProvide 2% calcium for 2 after they were born.If you notice that they are not gaining the expected weight, then you need to serve the starting food for 8 weeks.Serve the feed 2 or 3 times a day until they are 18 weeks old.Demand for feed increases rapidly when birds begin to spawn.Serve them the layer poultry feed according to their age and weight.Do not decrease the amount of feed feed feed increases). Body weight and associated consumption of feed for layer Etã (week) body weight (g) consumption of feed (g/bird/day) Etã (week) body weight (g) consumption of feed (g/bird/day) 1701310870-9705621152011960 -1080613190251210501111764 28029131130-1250705380-39033141210-1310736480-50037151290-13757580-620411360-1 430778680-750461450-154080970-860 and weight table. Duck duck duck duck duck need to be powered once in the morning and again in the evening. It is very important to provide a balanced diet containing adequate nutrients that include vitamins, minerals and proteins. Consumer levels vary according to their size. On average, they eat from 6 to 7 ounces of food every day; and which translates into about 170 to 200 grams. The quantity of food for a duck depends mainly on the species and the purpose you have to relieve them for the production of meat, ovoding, or as a pet. About 16% of the diet must contain proteins if they breed ducks to lay eggs. However, the consumption of an unbalanced diet at the end affects the health of the bird, as well as on the production capacity of the eggs. The ducks can be grown with pellets and pellet feeding, even if slightly expensive, has distinct advantages such as savings in the quantity of feed, minimum waste, savings of labor, comfort and improvement of hygiene conditions. Ã ¢ â € â € âœstarter and Growerã ¢ â € available at the local feed shop, until they are feathered and ã ¢ â € â € âœuer and finisherã ¢ â € Finals for adults. Never feed those medicated feed for poultry and ducks are good collectors. The use of the courtyard, drainage or an additional green feed such as grass reduces the cost of the feed. feed for duck poultry Ingredients (kg/100kg) Starter 0-2 weeksCrop layer (from 21 weeks) 3-8 weeks9-20 weeks Crushed maize41 404 040Rice polish10 131 410Wheat rind5874Rice rind5785Till oil cake107 108 soy12 dried crushed fish108 810Meat meal5536Bone meal0.50.50.5Oyster bone0.50.5Oyster bone0.50.50.5Oyster bone0.50.5Oyster And the mixture of vitamin1.51.51.52.0 Feed of ducks and nutrition ducks are voracious eaters and foragers. There are generally two duck methods, or wet mash method and pellet method. Mash wet must be supplied 5 times a day during the meditabondo period and subsequently 3 to 4 times a day. The power supply must be enough to eat only up to 10 minutes. The feed left must be removed after each diet. Dragons are aggressive power supplies and therefore, if suitable measures are not taken, there is a high possibility of misalignment in the consumption of dragons and hens feed. It is recommended to give enough space for dragons and hens to be fed separately, to avoid competition. Therefore, aggressive dragons can end up causing injuries to hens or even kill them. Increases the quantity of feed during the cold cold, the ducks have required more energy to grow and produce eggs. The recommended increase is about 2-5 pounds for every 100 birds. Feel the ducks with feed for high quality ducks to maximize growth and also prevent nutritional deficiencies. Place the duck power in a shallow heavy power supply, to avoid waste. In addition, give fresh and clean water birds together with the food, so that they can appease their thirst every time it is necessary. Provide grit to the ducks, if they are not let out of their fences for foraging and mix the grit in the feed once a week. If you have a small flock, you can reduce power costs by giving stale bread waste and kitchen. However, boil the waste well to kill the bacteria and then mix the food pellets.
